

Our high-performance glass coating is a Nanotechnology product that is an extremely hard-wearing, water and dirt repellent for glass surfaces.

How It Works:

Our hydrophobic product works by repelling water and preventing adhesion of foreign matter on the surface giving it an easy to clean effect.

An ultra-thin and invisible coating adheres to the glass surface allowing water to run off easily from the treated surface.

All dirt particles are washed off by rain or when rinsed with water.

General Characteristics:

Microscopically, glass is not completely smooth, so dirt and water on the surface can build up easily.

The glass treatment allows the dirt in combination with water to simply wash off leaving a clean surface.

The coating protects the glass surfaces against permanent stubborn stains like salt and calcium.

The coating is long-lasting and is UV and change temperature steady. It cannot be removed by water, cleaning agent or with high-pressure equipment. Protected surfaces are very simple to maintain.

Benefits:

Economical and Nano-based

Long lasting UV Resistant

Water and dirt repellent

Easy to clean/self-cleaning effect

Excellent abrasion resistance

Excellent protection for new and old surfaces.

keeps glass clear

Applications:

Windows

Skylights

Glass pool fencing

Façade panels

Glass balustrades

Shower Glass

Kitchen Splash Backs
